

Audit & Feedback

MetaLab

International Audit & Feedback MetaLab Meeting:
Putting A&F into real world practice

**Knowledge, attitudes and behaviors on Audit & Feedback:
evaluation of change in a sample of general practitioners
before and after the implementation of an intervention**

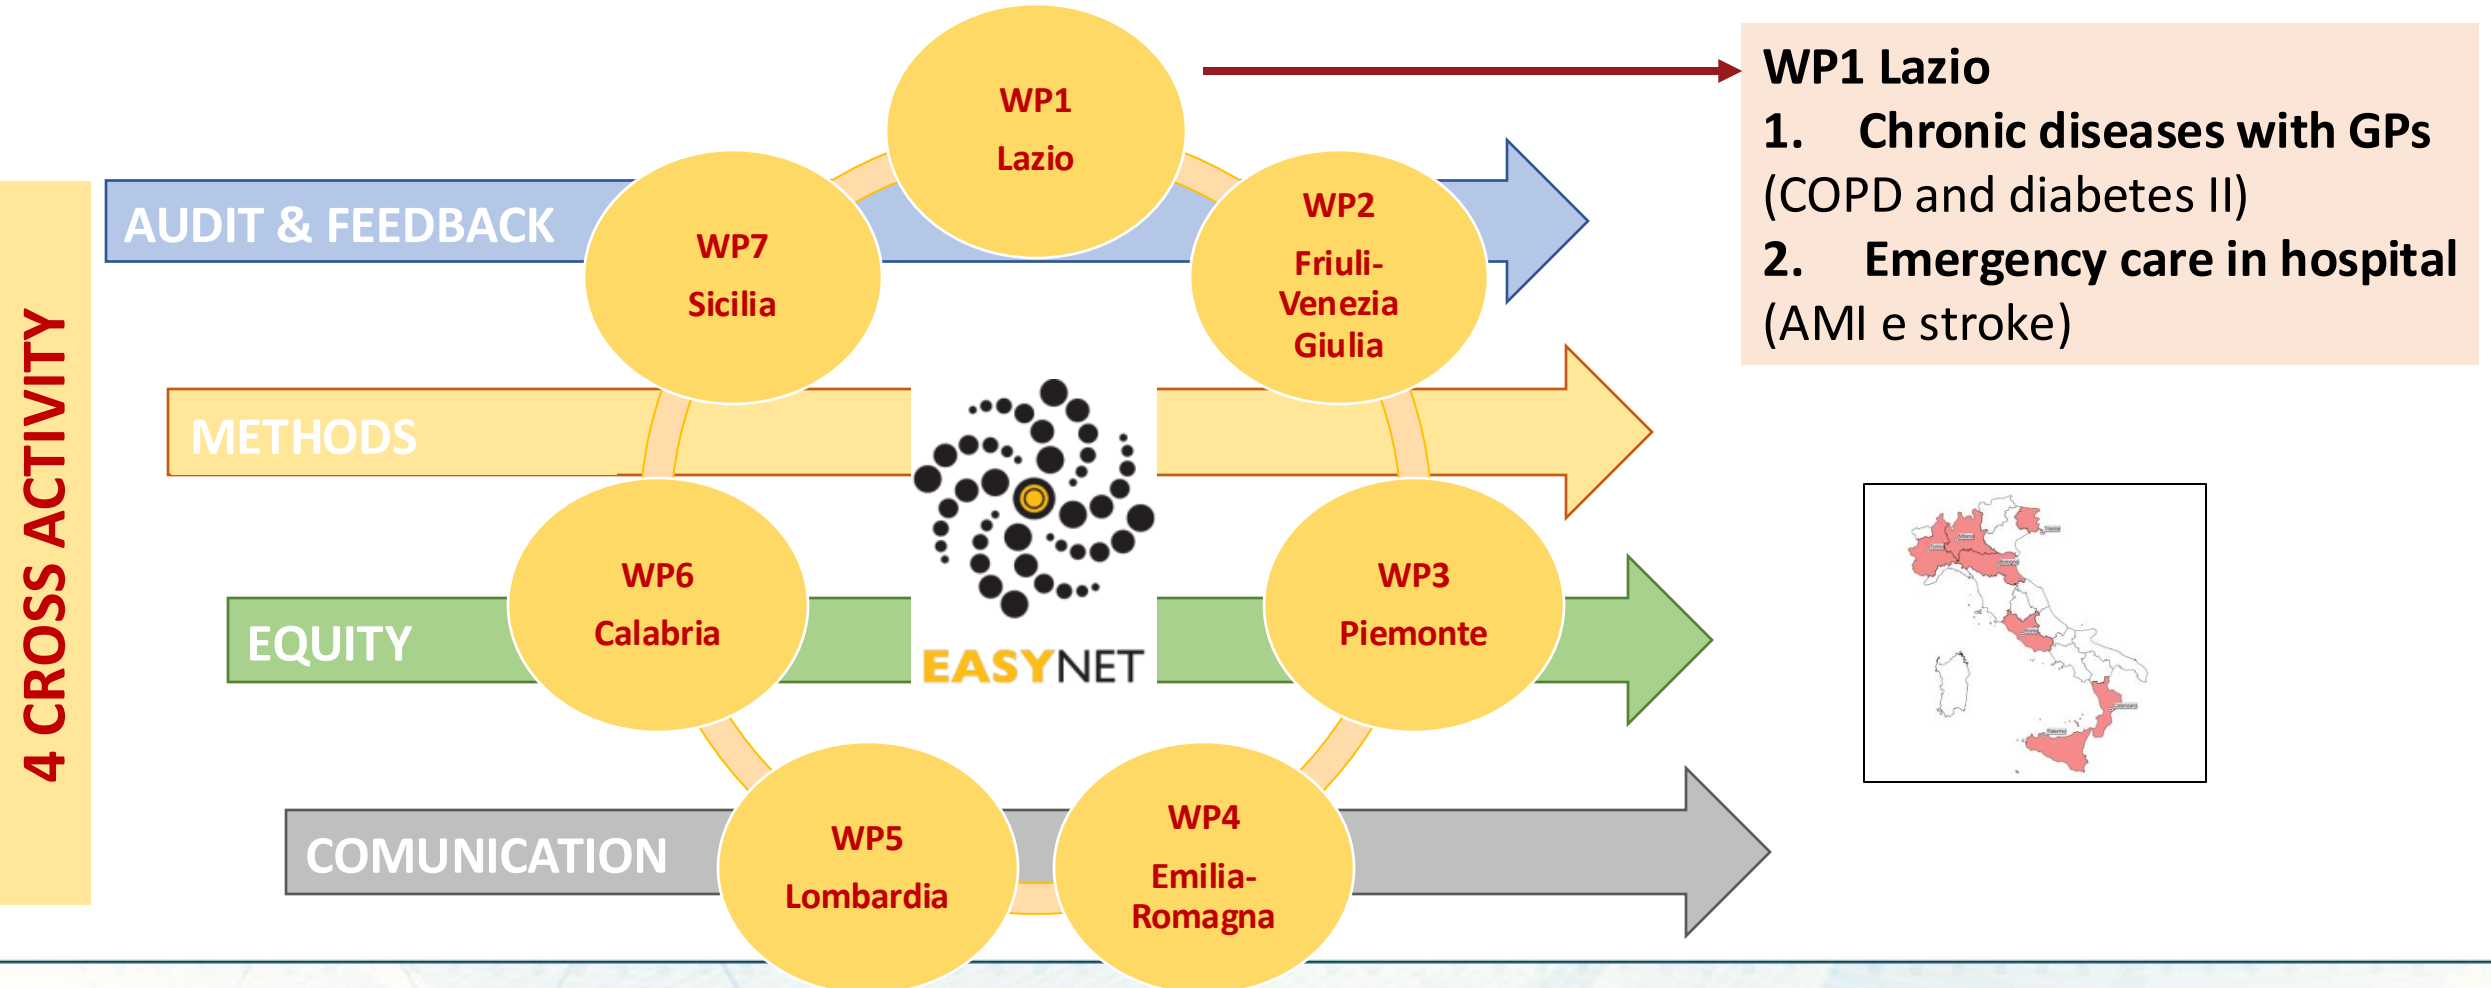

Angelo Nardi

Health District 2, Local Health Authority Roma 1

BACKGROUND (1) - EASY-NET PROGRAM

NET-2016-02364191

“Effectiveness of **A**udit and feedback **S**trategies to improve healthcare practice and equit**Y** in various clinical and organizational settings”

BACKGROUND (2) - CONTEXT

In Italy, and in the Lazio Region:

- Audit & Feedback methodology is **little known and rarely implemented** in Primary Care;
- General practitioners (GPs) are **self-employed and work as independent contractors** in the Italian National Health Service;
- General Practice has been **traditionally single-handed** for many years, recent reforms are working to spread and strengthen the group practice;
- Regional data (Lazio) highlight low adherence of GPs to some clinical guideline indications and **high variability between** GPs in different Local Health Districts and between single GPs.

BACKGROUND (3) - INTERVENTION

HIGH INTENSIVE INTERVENTION

145 volunteer GPs,
rewarded with continuing medical education credits

Meetings
with
specialists

Education & training course

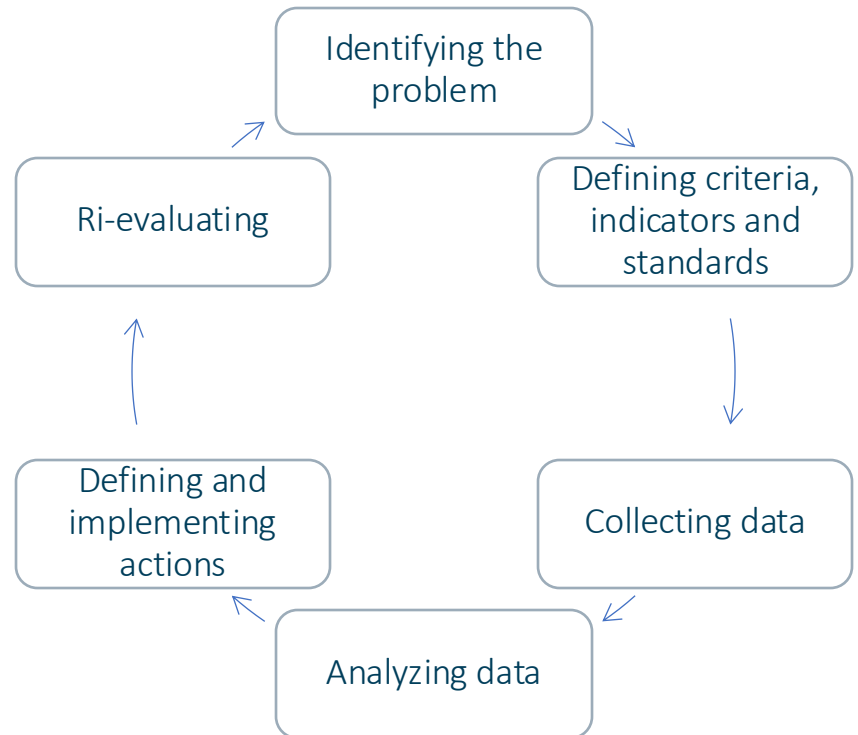

- Frontal lectures
- Small group training

LHD Director

In each of the 11 groups:

- 10-15 GPs
- 1 GP coordinator
- 1 Public Health MD representative for the LHD

Audit cycle

Feedback

- Data from HIS
- Data collected by GPs from their practice management software

BACKGROUND (4) – OBSTACLES AND ENABLING FACTORS

- One of the aims of the WP1 was to identify **obstacles and enabling factors** for the implementation of interventions at Local Health Authority, Health District and single general practitioner levels, using both **quantitative and qualitative approaches**;
- To this aim, after a scoping review of the literature, we **developed a survey to evaluate knowledge, attitudes and behaviours of GPs**, using a structured methodology;¹

Article

Developing a Questionnaire Evaluating Knowledge, Attitudes and Behaviors on Audit & Feedback among General Practitioners: A Mixed Methods Study

Angelo Nardi ^{1,*}, Suzanna Mitrova ², Laura Angelici ², Camillo Giulio De Gregorio ¹, Donatella Biliotti ³, Corrado De Vito ⁴, Simona Vecchi ², Marina Davoli ², Nera Agabiti ² and Anna Acampora ²

BACKGROUND (5) – SURVEY DEVELOPMENT

To **evaluate knowledge, attitudes and behaviours on A&F before and after** the implementation of the theoretical-practical intervention **in a sample of general practitioners***

*The following slides contain preliminary results, not already published

MATERIAL AND METHODS (1)

- The questionnaire was electronically delivered using Google Forms;
- Pre-intervention administration: survey was sent to all the GPs participating in the EASY-NET program during four introductory webinars (four groups of 30-40 GPs);
- Post-intervention administration: during the last meeting of each group (11 groups of 10-15 GPs).

MATERIAL AND METHODS (2)

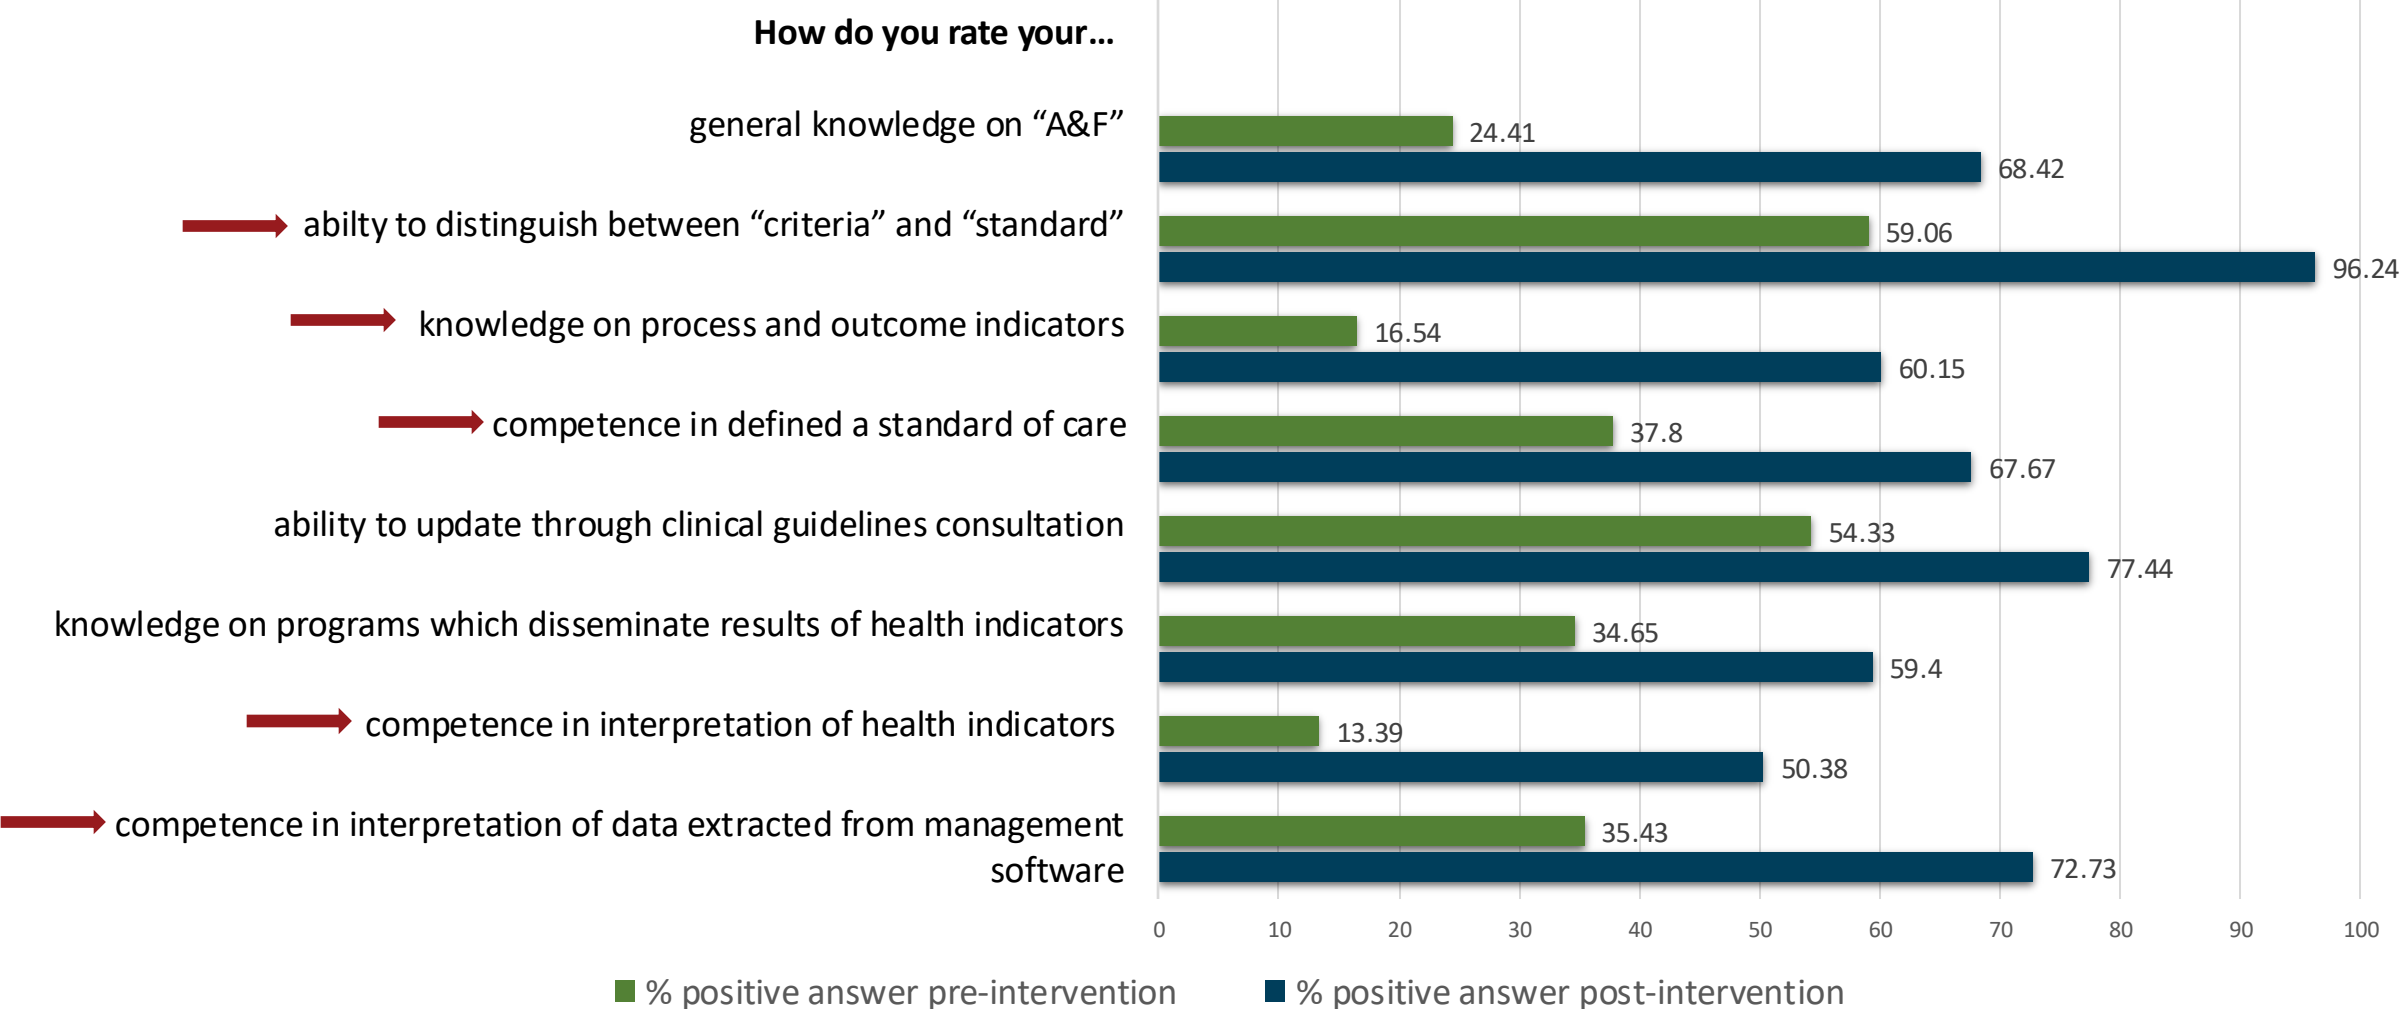

- All the answers were dichotomized in negative (≤ 3) and positive (> 3)
- Descriptive analysis of the responders
- Descriptive analysis of the pre-post intervention changes for each item
- Graphic representation through bar graphs

RESULTS (1)

Descriptive analysis of the responders			
	Pre-intervention	Post-intervention	Test pre-post (Chi2 or Wilcoxon)
Gender			
Men	62 (48.8%)	63 (47.4%)	P = 0.815
Women	65 (51.2%)	70 (52.6%)	
Median age	60 (IQR 54 – 63)	61 (IQR 55 – 65)	P = 0.2126
District			
A	100 (78.7%)	102 (76.7%)	P = 0.692
B	27 (21.3%)	31 (23.3%)	

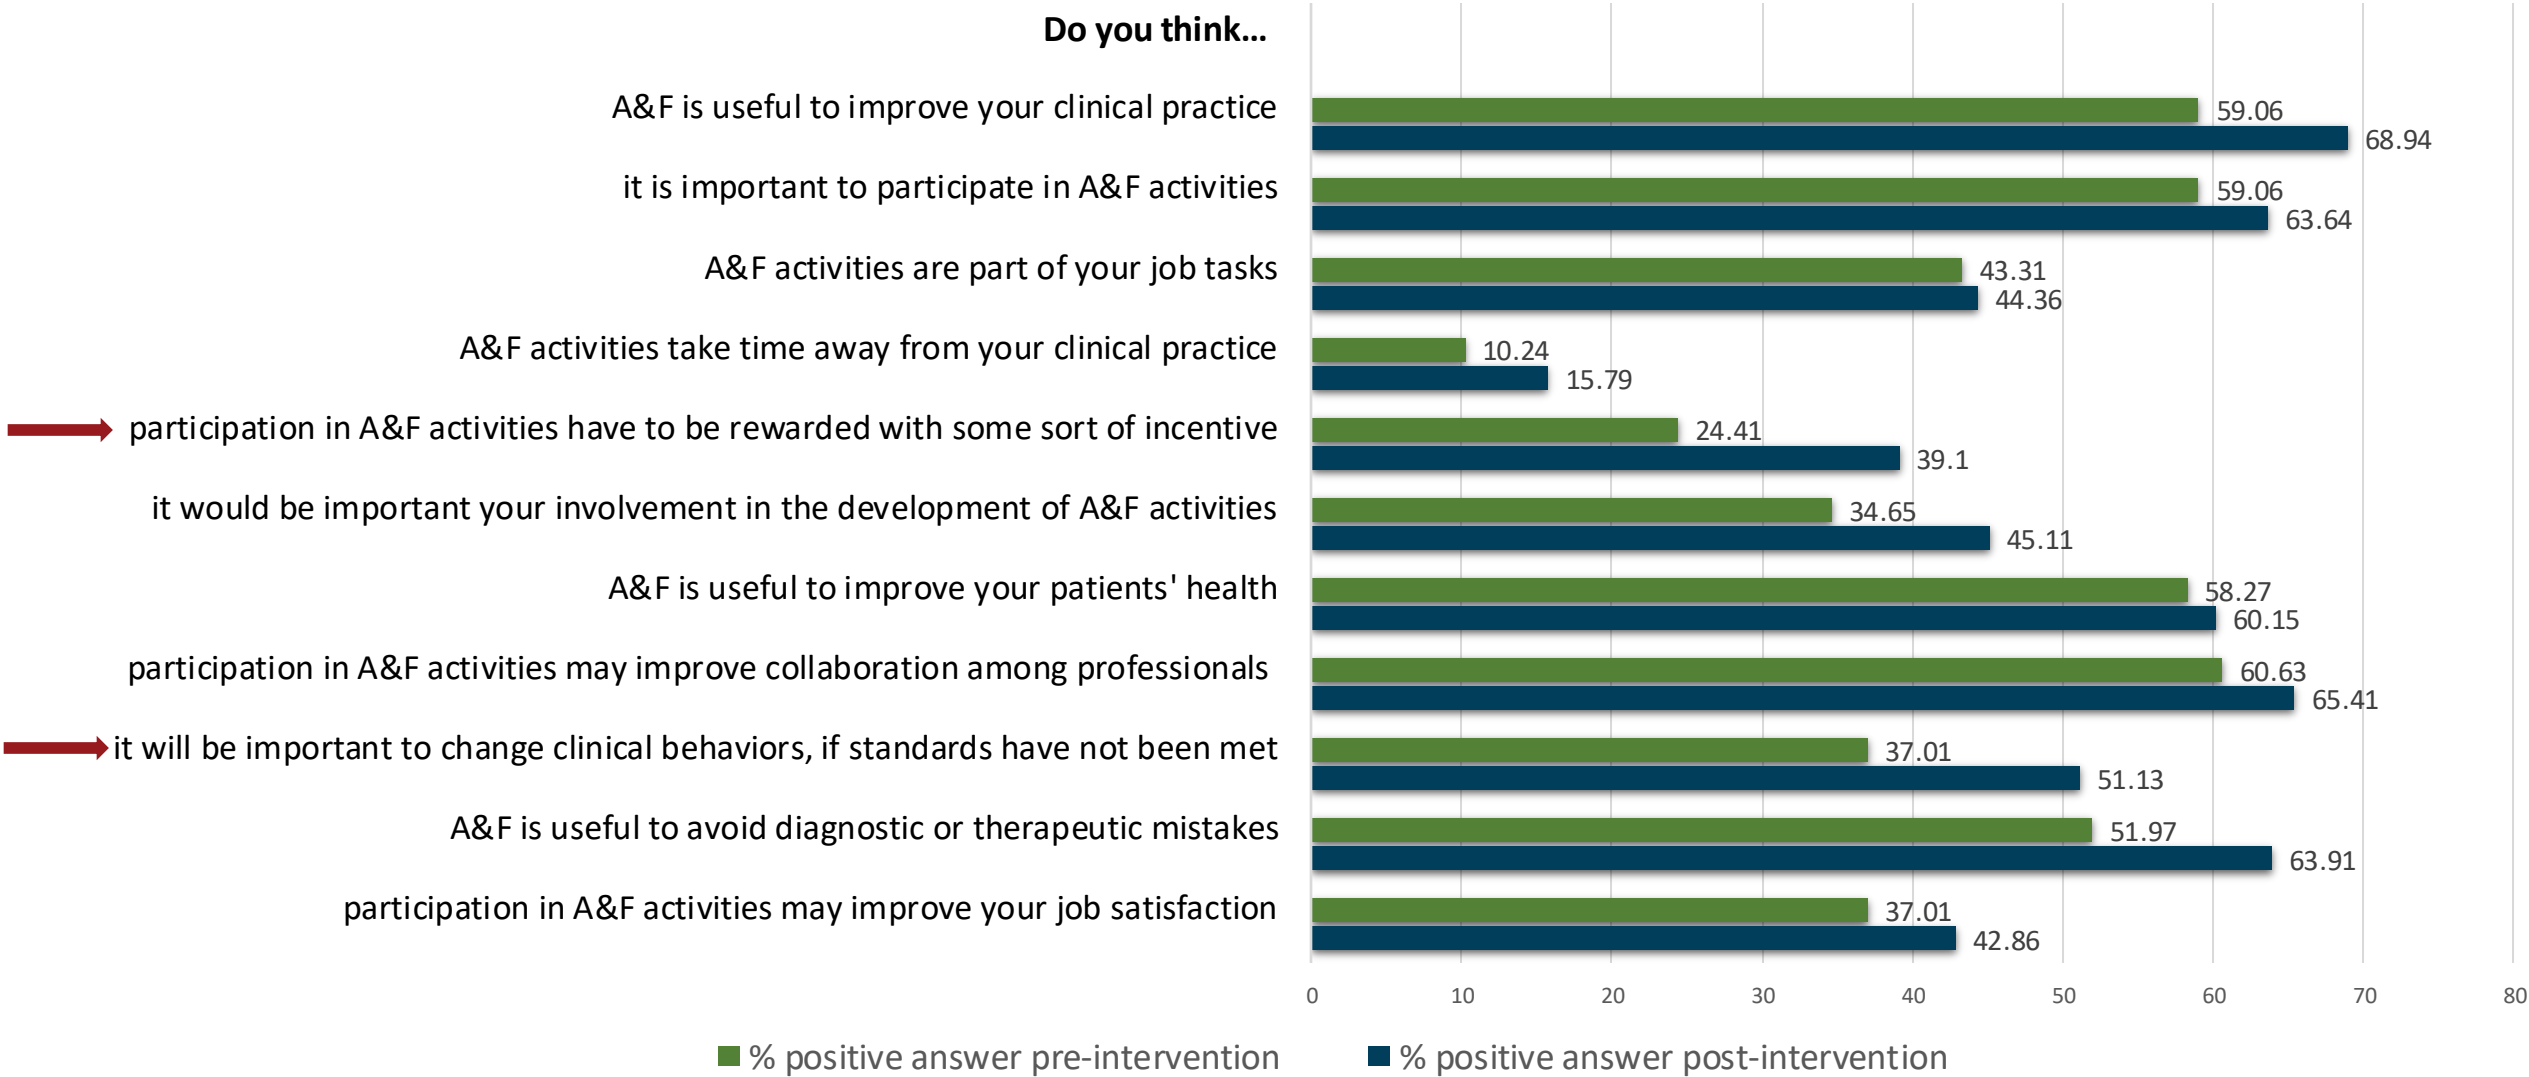

RESULTS (2)

Figure 1. % positive answers knowledge domain

RESULTS (3)

Figure 2. % positive answers attitude domain (1)

RESULTS (4)

Figure 2. % positive answers attitude domain (2)

RESULTS (5)

Figure 3. % positive answers behaviours domain

CONCLUSION

- After the intervention, the number of GPs who answered positively increased **more in the knowledge domain**, less in the attitude and in the behaviours domains.
- On one hand, it is well known that **knowledge domain is the first to change** in the behaviour change process. On the other hand, some evidence suggested that to some behaviours are not influenced by the knowledge.
- Factors related to intervention characteristics, such as the intensity of the course, **the focus on methodology more than on the outcomes**, and no regularity in feedback delivery, may explain significant changes in some items, but not in others.
